

THINGS YOU SHOULD KNOW ABOUT YOUR Black Slate

- Black Slate is prone to scratching.
- Finish may be hazy or inconsistent due to variation in stone.
- Black Slate has porosity in the stone. This porosity may lead to finger printing and water spots; these prints and spots take place when oils from human touch are transferred to the material. These oils transfer on any stone, but are much more apparent in Black Slate. Water spotting may occur when placing a glass on the surface, and the condensation on the side of the cup drips on to the stone. These spots will usually dry out, but will cause a variation in surface appearance for days or weeks.
- Cooking oils will also spot Black Slate.

CR Home cannot be held responsible for small inconsistencies in Black Slate after fabrication. CR Home recommends the customer view, approve, and sign off on Black Slate slabs prior to fabrication. These inconsistencies do not imply any weakness or lower performance.

CR Home is not responsible for Black Slate which may vary from samples provided.

I have read this document and know what to expect regarding Black Slate.
